disease and for drug screening

'S Claim 19: Page 203-204; 238pp; English.

This polypeptide comprises human presentlin-2 (hPS2). Its amino
acid sequence was deduced from an isolated CDNA clone (see V04669).

The man and murine presentlin-1 sequences are also provided (see
W13964-66). Mutations in the PS-1 and PS-2 genes are linked to
the development in humans of forms of familial Alzheimer's disease
(FAD) and may be causative of other disorders, e.g. cognitive,
intellectual, ineurological or physiological disorders such as
cerebral haemorrhage, schizophrenia, depression, mental retardation
and epilepsy. Use of the nucleic acids and proteins comprising or
cerebral haemorrhage, schizophrenia, depression, mental retardation
and epilepsy. Use of the nucleic acids and proteins comprising or
cerebral haemorrhage and tamagenic short treatment of FAD,
and in producing cell lines and transgenic animals useful as models
condulate the activity of a presentlin protein, and methods for
identifying substances that bind to, or
identifying substances that affect the interaction of a
presentlin-interacting protein with a presentlin protein are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated mutant presentlin-1 genes - useful for developing products for use in detection, diagnosis and therapy of Alzheimer's
                                                                                                                                                                                                                                                                                'note= "Asn14111e mutation site (Claim 19)"

New presentiin genes - useful for diagnosis, therapy and drug

PT New presentiin genes - useful for diagnosis, therapy and drug

PT Screening of familial Alzheimer's disease, cerebral disorders, etc.

Claim 4, Page - 178pp; English.

WOS763-WOS765 represent mutated versions of the human presentlin-2

CC Of Mighly conserved integral membrane proteins with a common structural

CC of highly conserved integral membrane proteins with a common structural

CC of highly conserved integral membrane proteins with a common structural

CC of highly conserved integral membrane proteins with a common structural

CC regions. Mutations in PS genes are implicated in familial Alzheimer's

CI sease (AD) and possibly other diseases such as cerebral haemorrhage,

Schizophrenia, depression etc., so detection of mutations in the DNA

cencoding the wild type sequences can be used for diagnosis of these

CC diseases. The wild type proteins, or vectors that express them or

CC containing antisense sequences, antibodies selective for these mutant

CC forms of the proteins and modulators of PS gene expression are

Detentially useful for treatment of AD etc. Transgenic animals are useful

Claim 29; Fig 29; 77pp; English.

Identifying genes which cause improper chromosome segregation, screening for inhibitors of chromosome missegregation promoters was exemplified using Alzhahmer's disease. The sequences given in T87401 to T87426 can be used in the above methods. It is not clear from the figure legend, the figure and the disclosure of the specification which sequence of Fig 1 and Fig 28 is the Abd/Ab3ip or the Ab3 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying genes which cause chromosome missegregation - useful for identifying causes of and treatments for diseases, e.g. Alzheimer's

Claim 4: Page -: 178pp; English.

W05763-W05766 represent mutated versions of the human presentlin-2

protein (see W05762 for wild type sequence). The presentlins are a family

of highly conserved integral membrane proteins with a common structural

motif, common alternate splicing patterns, and common mutational hot spot

cegions. Mutations in ps genes are implicated in familial Alzheimer's

disease (AD) and possibly other diseases such as cerebral haemorrhage,

schizophrenia, depression etc., so detection of mutations in the DNA

concaining the wild type sequences can be used for diagnosis of these

diseases. The wild type proteins, or vectors that express them or

containing antisense sequences, antibodies selective for these mutant

corrections of the proteins and modulators of PS gene expression are

potentially useful for treatment of AD etc. Transgenic animals are useful

as models for drug screening. The antibodies can also be used e.g. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-JUJ-1997 (first entry)

New isolated mutant presentiin-1 genes - useful for developing products for use in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

T products for use in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

Disclosure; Page 199-200; J38pp; English.

This polypeptide comprises the murine presentiin-1 (PS1) homologue. Its amino acids equence was deduced from an isolated CDNA clone (see V04668). Mutations in the human PS1 and PS2 genes (see V04666-68) have been linked to the development in humans of forms of familial Alzheimer's disease (FAD). All amino acids that are mutated in analysed FAD pedigrees (see W2364) were conserved in the murine homologue. Use of the nucleic acids and proteins comprising or derived from presentlins can be made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD. Methods for identifying substances that bind to, or modulate the activity of a presentlin protein, and methods for identifying substances that affect the interaction of a presentlin interacting protein with a presentlin protein are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GAISVYDLVAVLCPKGPLRMLVETAQERNEPIFPALIYSSAMVWTVGMAKLDPSSQGALQ 240

```
coding sequence for wild type human PS-2. The presenting are a family of highly conserved integral membrane proteins with a common structural motif. common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding these sequences can be used for diagnosis of these diseases. These proteins, or vectors that express them or containing antisense sequences, antibodies selective for mutant forms of these proteins (such as W03736) and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification
                                                                                                                                                                                                                                                                                                                <u>ن</u>

sel-12 protein - Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Species: 10-Apr-1996 #sequence_revision 19-Apr-1996 #text_change 13-Sep-1998
C; Accession: 560253
R; Levitan, D.; Greenwald, I.
Nature 377, 351-354, 1995
A; Title: Facilitation of lin-12-mediated signalling by sel-12, a Caenorhabditis elega A; Reference number: 560253; MUID:96032531
A; Accession: 560253
A; Status: preliminary; nucleic acid sequence not shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 presentlin 1, splice form 374 - human N;Alternate names: Alzheimer's disease protein 3 C;Species: Homo sapiens (man) C;Species: Homo sapiens (man) C;Date: 20-Jul-1996 #sequence_revision 13-Mar-1997 #text_change 29-Sep-1999 C;Accession: S63684 R;Sahara, N; Yahagi, Y; Takagi, H.; Kondo, T.; Okochi, M.; Usami, M.; Shirasawa, FEBS Lett. 381, 7-11, 1996 A;Title: Identification and characterization of presentlin I-467, I-463 and I-374. A;Reference number: S63683; MuID:96193001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Status: preliminary; nucleic acid sequence not shown

Particles membrane protein spe-4 - Caenorhabditis elegans
NiAlternate names: probable integral membrane protein
Cispecies: Caenorhabditis elegans
Cispecies: Caenorhabditis elegans
Cispecies: Caenorhabditis elegans
Cispecies: 10-Jun-1993 #sequence_ravision 18 Nov-1994 #text_change 09-Sep-1997
Cishcession: A43459; S24632; S24633
J. Cell Biol. 119, 55-68, 1992
A:Title: Mutation of a putative sperm membrane protein in Caenorhabditis elegans prevent
A:Reference number: A43459; MUID:92407040
A:Reference number: A43459
A:Status: preliminary; not compared with conceptual translation
A:Molecule type: DNA; mRNA
A:Residues: 1-465 <LHE>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A:Cross-references: EMBL:214067; NID:96868; PID:96869; EMBL:214066; NID:96870; PID:96871

Human presentitn-1 gene exoli Early onset Alzheimer's dise Presentlin-1 exon 9. New pre
      ! Presentlin-1 exon 12. New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New presenting genes - useful for diagnosis, therapy and drug screening of familial Alzheimer's disease, cerebral disorders, etc.

Claim 8: Page 148-150; 178pp; English.

This sequence represents the coding sequence for the human presentiin-2.

This sequence represent the coding sequence for the two different of the forms of wild type human presentiin-1 (PS-1). The form represented by 140029 results from alternate splicing of the genomic DNA sequence.

T40030 represents the coding sequence for wild type mouse PS-1. The presentlins are a family of highly conserved integral membrane proteins presentlins are a family of highly conserved integral membrane proteins of the form mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in these sequences can be used for diagnosis of these diseases. The encoded proteins, or vectors that express them or containing proteins (such as W03736) and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for sequence of a fifting purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                   25-JUL-1997 (first entry)
Human presentlin-2 wild type coding sequence.

Claim 28; Fig 28; 77pp; English.
Identifying genes which cause improper chromosome segregation, screening for inhibitors of chromosome missegregation and processes caused by genes encoding chromosome missegregation promoters was exemplified using Alzheimer's disease. The sequences given in T87401 to T87426 can be used in the above methods. It is not clear from the figure legend, the figure and the disclosure of the specification which sequence of Fig 1 and Fig 28 is the AD4/AD312P or the AD3 sequence.
Sequence 2276 BP; 494 A; 595 C; 662 G; 525 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P-PSDB; W22508.
Identifying genes which cause chromosome missegregation - useful for identifying genes of and treatments for diseases, e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                             07-DEC-1997 (first entry)
Full AD4/AD3LP sequence.
AD3: AD4/AD3LP sequence.
presenilin; inhibitor; AD; trisomy 21; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            192
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New presenting genes - useful for diagnosis, therapy and drug
Screening of familial Alzheimer's disease, cerebral disorders, etc.

Screening of familial Alzheimer's disease, cerebral disorders, etc.

Claim 8: Page 145-146; 178pp; English.

This sequence represents the coding sequence for the murine presentilh-1.

This sequence represent the coding sequence for the two different
corns of wild type human presentiln-1 (PS-1). The form represented by
T40029 results from alternate splicing of the genomic DNA sequence.

T40031 represents the coding sequence for wild type human PS-2. The
presentilins are a family of highly conserved integral membrane proteins
with a common structural motif, common alternate splicing patterns, and
common mutational hot spot regions. Mutations in PS genes are implicated
common mutational hot spot regions. Mutations in PS genes are implicated
common mutational hot spot regions. Mutations in PS genes are implicated
common mutations in these sequences can be used for diagnosis of these diseases.
The encoded proteins, or vectors that express them or containing
antisense sequences, antibodies selective for mutant forms of the encoded
proteins (such as W05736) and modulators of PS gene expression are
potentially useful for treatment of AD etc. Transgenic animals are useful
as models for drug screening. The antibodies can also be used e.g. for
affinity purification and in immunoassays.
                                                                                                                                                                                   23-JUL-1997 (first entry)
